PHILIPS

4 x 12 W single-ended car radio power amplifier with dynamic distortion detector and diagnostic interface

TDA8562Q

FEATURES

- Requires very few external components
- High output power
- Fixed gain
- Diagnostic facility (distortion, short-circuit and temperature detection)
- Good ripple rejection
- Mode select switch (operating, mute and stand-by)
- Load dump protection
- AC and DC short-circuit safe to ground and to V_P
- Low power dissipation in any short-circuit condition
- Thermally protected
- Reverse polarity safe
- Electrostatic discharge protection
- No switch-on/switch-off plop
- Flexible leads
- Low thermal resistance
- Identical inputs.

GENERAL DESCRIPTION

The TDA8562Q is an integrated class-B output amplifier in a 17-lead single-in-line (SIL) power package. It contains 4 × 12 W single-ended amplifiers.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_P	positive operating supply voltage		6	14.4	18	V
I_{ORM}	repetitive peak output current		–	–	4	A
I_P	total quiescent current		–	80	–	mA
I_{sb}	stand-by current		–	0.1	100	μA
P_o	output power	THD = 10%				
		4 Ω	–	7	–	W
		2 Ω	–	12	–	W
RR	supply voltage ripple rejection		48	–	–	dB
V_{no}	noise output voltage	$R_s = 0\ \Omega$	–	50	–	μV
$\lvert Z_I \rvert$	input impedance		50	–	–	kΩ

OUT 2	8	output 2
n.c.	9	not connected
OUT 3	10	output 3
GND2	11	power ground 2
OUT 4	12	output 4
V_{P2}	13	supply voltage
MODE	14	mode select switch input
IN 3	15	input 3
V_{DIAG}	16	diagnostic output
IN 4	17	input 4

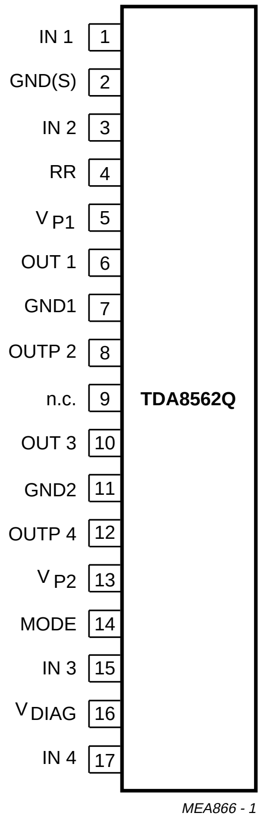

Fig.2 Pin configuration.

The device is primarily developed for car radio applications.

FUNCTIONAL DESCRIPTION

The TDA8562Q contains four identical amplifiers and can be used for single-ended applications. The gain of each amplifier is fixed at 20 dB. Special features of the device are:

Mode select switch (pin 14)

- low stand-by current (< 100 μA)
- low switching current (low cost supply switch)
- mute facility

To avoid switch-on plops, it is advised to keep the amplifier in the mute mode during ≥ 100 ms (charging of the input capacitors at pin 1, 3, 15 and pin 17).

This can be achieved by:

- microprocessor control
- external timing circuit (see Fig.7)

Diagnostic output (pin 16)

DYNAMIC DISTORTION DETECTOR (DDD)

At the onset of clipping of one or more output stages, the dynamic distortion detector becomes active and pin 16 goes low. This information can be used to drive a sound processor or DC volume control to attenuate the input signal and thus limit the distortion. The output level of pin 16 is independent of the number of channels that are clipping (see Fig.3).

SHORT-CIRCUIT PROTECTION

When a short-circuit occurs at one or more outputs to ground or to the supply voltage, the output stages are switched off until the short-circuit is removed and the device is switched on again, with a delay of approximately 20 ms, after removal of the short-circuit. During this short-circuit condition, pin 16 is continuously low.

When a short-circuit across the load of one or more channels occurs the output stages are switched off during approximately 20 ms. After that time it is checked during approximately 50 µs to see whether the short-circuit is still present. Due to this duty cycle of 50 µs/20 ms the average current consumption during this short-circuit condition is very low (approximately 40 mA).

During this short-circuit condition, pin 16 is low for 20 ms and high for 50 µs (see Fig.4).

The power dissipation in any short-circuit condition is very low.

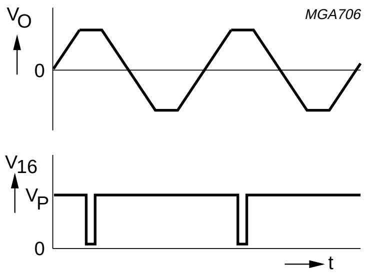

Fig.3 Distortion detector waveform.

TEMPERATURE DETECTION

When the virtual junction temperature T_{vj} reaches 150 °C, pin 16 will be active LOW.

OPEN COLLECTOR OUTPUT

Pin 16 is an open collector output, which allows pin 16 of more devices being tied together.

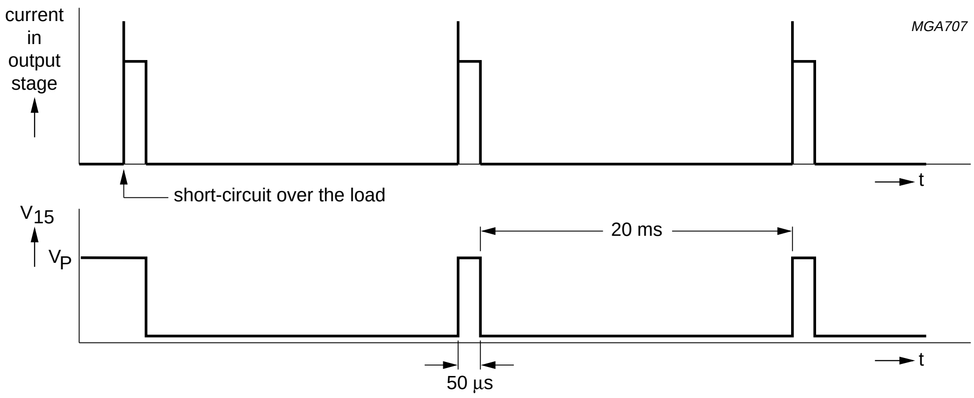

Fig.4 Short-circuit waveform.

LIMITING VALUES

In accordance with the absolute maximum system (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_P	positive supply voltage				
	operating		–	18	V
	non-operating		–	30	V
	load dump protection	during 50 ms; $t_r \geq 2.5$ ms	–	45	V
I_{OSM}	non-repetitive peak output current		–	6	A
I_{ORM}	repetitive peak output current		–	4	A
T_{stg}	storage temperature		–55	+150	°C
T_{amb}	operating ambient temperature		–40	+85	°C
T_{vj}	virtual junction temperature		–	150	°C
V_{psc}	AC and DC short-circuit safe voltage		–	18	V
V_{pr}	reverse polarity		–	6	V
P_{tot}	total power dissipation		–	60	W

THERMAL RESISTANCE

In accordance with IEC 747-1.

SYMBOL	PARAMETER	THERMAL RESISTANCE
$R_{th\ j\text{-}a}$	from junction to ambient in free air	40 K/W
$R_{th\ j\text{-}c}$	from junction to case (see Fig.5)	1.3 K/W

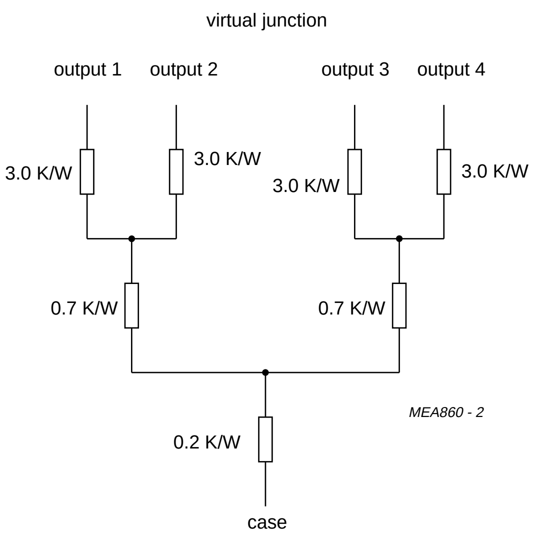

Fig.5 Equivalent thermal resistance network.

DC CHARACTERISTICS

V_P = 14.4 V; T_{amb} = 25 °C; measured in Fig.6; unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
Supply						
V_P	positive supply voltage	note 1	6	14.4	18	V
I_P	quiescent current		–	80	160	mA
V_O	DC output voltage	note 2	–	6.9	–	V
Mute select switch						
V_{on}	switch-on voltage level		8.5	–	–	V
MUTE CONDITION						
V_{mute}	mute voltage		3.3	–	6.4	V
V_O	output voltage in mute position	V_{Imax} = 1 V; f = 1 kHz	–	–	2	mV
STAND-BY CONDITION						
V_{sb}	stand-by voltage		0	–	2	V
I_{sb}	stand-by current		–	–	100	μA
I_{sw}	switch-on current		–	12	40	μA
Diagnostic output (pin 16)						
V_{DIAG}	diagnostic output voltage	any short-circuit or clipping	–	–	0.6	V

AC CHARACTERISTICS

V_P = 14.4 V; R_L = 4 Ω; f = 1kHz; T_{amb} = 25 °C; measured in Fig.6; unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
P_O	output power	note 3				
		THD = 0.5%	4	5	–	W
		THD = 10%	5.5	7	–	W
THD	total harmonic distortion	P_O = 1 W	–	0.1	–	%
P_O	output power	R_L = 2 Ω; note 3				
		THD = 0.5%	–	10	–	W
		THD = 10%	–	12	–	W
f_l	low frequency roll-off	at –3 dB; note 4	–	45	–	Hz
f_h	high frequency roll-off	at –1 dB	20	–	–	kHz
G_v	closed loop voltage gain		19	20	21	dB
RR	supply voltage ripple rejection	note 5				
	on		48	–	–	dB
	mute		48	–	–	dB
	stand-by		80	–	–	dB
$\|Z_I\|$	input impedance		50	60	75	kΩ
V_{no}	noise output voltage					
	on	R_s = 0Ω; note 6	–	50	–	μV
	on	R_s = 10 kΩ; note 6	–	70	100	μV
	mute	notes 6 and 7	–	50	–	μV
α	channel separation	R_s = 10 kΩ	40	–	–	dB
$\|\Delta G_v\|$	channel unbalance		–	–	1	dB
Dynamic distortion detector						
THD	total harmonic distortion	V_{16} ≤ 0.6 V; no short-circuit	–	10	–	%

Notes

1. The circuit is DC adjusted at V_P = 6 to 18 V and AC operating at V_P = 8.5 to 18 V.
2. At 18 V < V_P < 30 V the DC output voltage ≤ V_P/2.
3. Output power is measured directly at the output pins of the IC.
4. Frequency response externally fixed.
5. Ripple rejection measured at the output with a source-impedance of 0 Ω, maximum ripple amplitude of 2 V (p-p) and at a frequency of between 100 Hz and 10 kHz.
6. Noise measured in a bandwidth of 20 Hz to 20 kHz.
7. Noise output voltage independent of R_s (V_I = 0 V).

TEST/APPLICATION INFORMATION

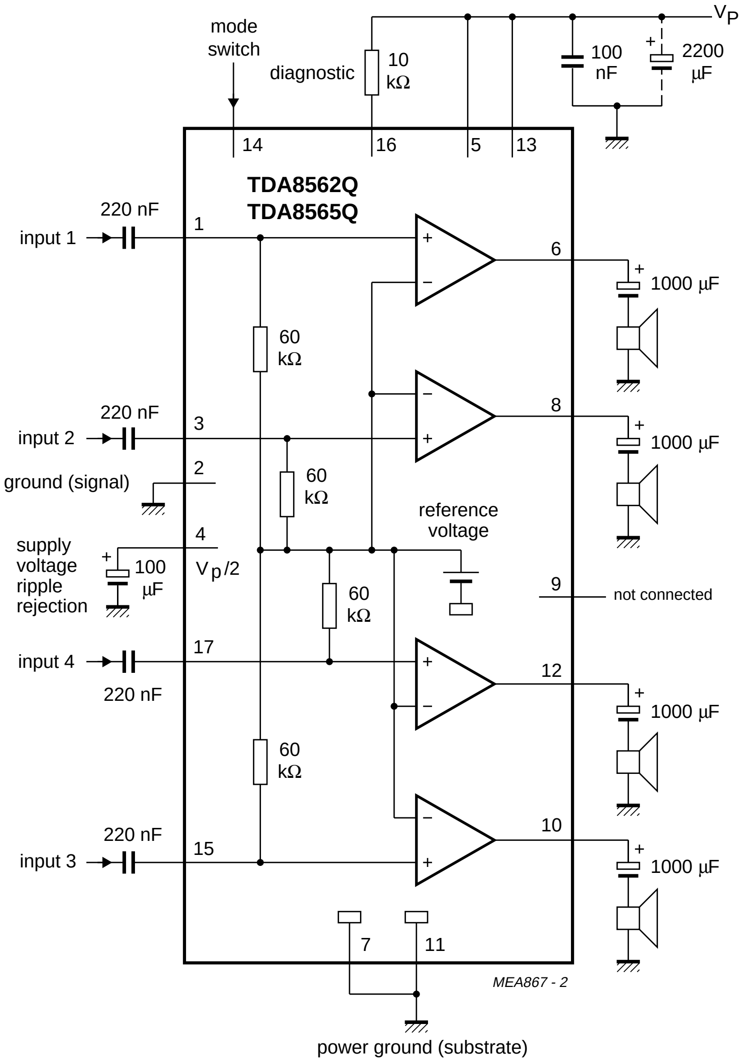

Fig.6 Application diagram.

Mode select switch

To avoid switch-on plops, it is advised to keep the amplifier in the mute mode during > 100 ms (charging of the input capacitors at pins 1, 3, 15 and 17.

The circuit in Fig.7 slowly ramps up the voltage at the mode select switch pin when switching on and results in fast muting when switching off.

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg\ max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
